

THUNDERFOIL™

DIRECTIONS:

Place the kite on the ground so that the bridle and "Thunderfoil" are face up. Detach the tow points of the bridle from the trailing edge loops. The bridle is shipped this way for tangle free storage. The loops can be used to re-attach the bridle when you are done flying to keep the bridle from tangling.

Attach your flying line to each of the bridles using a larkshead slipknot (see below). Sand or small stones placed on the trailing edge of the Thunderfoil will prevent it from blowing away and will make it easier to solo launch.

Before launching the Thunderfoil™, pull back slightly with both lines to open the cells for the wind to inflate. To launch, pull quickly and evenly with both lines. After your kite is airborne, pulling the right line will turn the wing to the right and pulling the left line will turn it to the left. Pull and hold one line back and the kite will turn in a complete circle. Hold your hands evenly (neutral position) and the kite will fly straight in any direction the nose is pointed.

To land, fly the kite to your far right or left corner. The kite will start to descend and gently touch down. To prevent accidental relaunching, have a friend grab it when it is on the ground.
